FRESHGRO

FreshGro is an online web application for automating the process of ordering grocery products from suppliers and paying for it in advance. Therefore, there is no need for the suppliers to wait for a long time and pay as cash at the time of delivery. This system also helps farmers to sell their product through this system.

The current system is not much efficient and can lead to a major waste of time as the supplier needs to wait for a long period of time. The main purpose to design this application is providing an environment where user will be able to order products from supplier and pay in advance.

Modules:

- **Admin**
- **Staff**
- **Supplier**
- **Farmer**
